WARNING!
Improper installation, adjustment, alteration, service or maintenance can cause injury or property damage. Refer to this manual. For assistance or additional information consult a qualified installer, service agency or the gas supplier.

NOTICE
Upon completion of the installation, these instructions should be handed to the user of the appliance for future reference.

⚠️ WARNING: If the information in these instructions is not followed exactly, a fire or explosion may result causing property damage, personal injury or death.

- Do not store or use gasoline or other flammable vapors and liquids in the vicinity of this or any other appliance.

- WHAT TO DO IF YOU SMELL GAS
  • Do not try to light any appliance.
  • Do not touch any electrical switch; do not use any phone in your building.
  • Immediately call your gas supplier from a neighbor’s phone. Follow the gas supplier’s instructions.
  • If you cannot reach your gas supplier, call the fire department.

- Installation and service must be performed by a qualified installer, service agency or the gas supplier.

1 Key to symbols and safety instructions

1.1 Key to symbols

Warnings

In warnings, signal words at the beginning of a warning are used to indicate the type and seriousness of the ensuing risk if measures for minimising danger are not taken.

The following signal words are defined and can be used in this document:

⚠️ DANGER:

DANGER indicates a hazardous situation which, if not avoided, will result in death or serious injury.

⚠️ WARNING:

WARNING indicates a hazardous situation which, if not avoided, could result in death or serious injury.

⚠️ CAUTION:

CAUTION indicates a hazardous situation which, if not avoided, could result in minor or moderate injury.

➤ NOTICE:

NOTICE is used to address practices not related to personal injury.

Important information

The info symbol indicates important information where there is no risk to people or property.

1.2 Safety instructions

⚠️ WARNING:

Before installation,

➤ Read all instructions. Perform the steps in the indicated sequence.
➤ Have the water heater inspected by a trained service technician at least once every year.
➤ Failure to comply with these instructions can result in severe, possibly fatal, personal injury as well as damage to property and equipment.

⚠️ DANGER:

Installation and servicing.
Risk of fire when soldering and brazing!

➤ Take appropriate protective measures when soldering and brazing around combustible and flammable material.
➤ Ensure that only a licensed contractor installs or services the water heater.
➤ On hot components use only material with adequate temperature stability.

⚠️ CAUTION:

➤ To ensure that the water heater functions properly, follow these installation and maintenance instructions.
➤ Never close the blow-off line of the pressure safety valve. For safety reasons, water may escape during heating.

Symbol | Meaning
--- | ---
➤ | a step in an action sequence
⇒ | a reference to a related part in the document
• | a list entry
– | a list entry (second level)

Table 1
⚠️ DANGER:
Risk of explosion!

If you smell gas.
▶ Turn off the gas shut-off valve.
▶ Open windows and doors.
▶ Do not try to light the appliance.
▶ Do not touch any electrical switch, telephone, and do not use outlets.
▶ Extinguish all open flames. Do not smoke! Do not use lighters!
▶ Warn all occupants of the building. Do not ring doorbells!
▶ If you can hear gas leaking, leave the building immediately.
▶ Prevent others from entering the building and notify the police and fire department from outside the building.
▶ From outside the building, call the gas utility company and a trained and certified installer.

⚠️ DANGER:
If you smell flue gas,
▶ Switch off the appliance.
▶ Open windows and doors.
▶ Inform the certified installer who installed the appliance.

⚠️ DANGER:
Risk of poisoning!
Insufficient ventilation may cause toxic flue gas to escape.
▶ Never close off or reduce the size of the air intake and outlet openings.
▶ The appliance must not be operated until any obstructions have been removed.
▶ Inform the customer of the problem and the associated dangers.

⚠️ DANGER:
Danger from escaping flue gases.
▶ Ensure all vent pipes and chimneys are not damaged or blocked.
▶ Connect only one appliance to each vent system or chimney liner.
▶ The venting system piping must not feed into another air extraction duct.
▶ Do not route the flue system piping through or inside another air extraction duct.

⚠️ DANGER:
Danger of explosion of flammable gases.
▶ Work on gas components may only be carried out by a trained and certified installer.
▶ Installation, gas and flue connection, initial commissioning, electrical connections and annual maintenance must only be carried out by a trained and certified installer.

⚠️ CAUTION:
Combustion air.
▶ Keep the combustion air free of corrosive substances (halogenated hydrocarbons that contain chlorine or fluorine compounds).
⚠️ WARNING:
Never shut off safety valves!
▶ Water may escape from the safety valve at any time when the water is being heated.

⚠️ WARNING:
Inspection/maintenance
▶ Servicing and repairs may only be carried out by a trained and certified installer.
▶ Immediately correct all faults to prevent system damage.
▶ Use only Bosch spare parts!

⚠️ CAUTION:
Instruct the customer.
▶ Explain to the customer how the appliance works and how to operate it.
▶ Inform the customer that he/she must not carry out any alterations or repairs.

⚠️ DANGER:
Risk of electric shock!
▶ Ensure that only an authorized contractor performs electrical work.
▶ Before performing electrical work, disconnect the power and secure the unit against unintentional reconnection.
▶ Ensure the system has been disconnected from the power supply.

⚠️ DANGER:
Risk of scalding at the hot water fixture!
▶ When the water heater is in operation, temperatures in excess of 120 °F (49 °C) can occur. To limit the temperature at the faucet, install a thermostatic DHW mixing valve.
▶ Water heated for washing the laundry, dishes and for other cleaning purposes can cause scalding and permanent injuries.
▶ Children, disable and elderly are at highest risk of being scalded. Never leave such individuals in the tub or shower unattended under any circumstances. Children must not be allowed to operate hot water faucets themselves.
▶ If the building has occupants in the above groups who operate hot water faucets, or state laws / local ordinances stipulate specific water temperatures, take the following precautions:
  – Use the lowest possible temperature setting.
  – To prevent scalding, install a tempering device, such as an automatic mixing valve, at hot water faucet or water heater. Select and install the automatic mixing valve in accordance with the valve manufacturer's recommendations and instructions.
Water exiting from drain valves can be extremely hot. To avoid injuries:
- Check that all connections are tight.
- Direct exiting water away from people.
Measures must be taken to protect against excessive temperature and pressure! Installation of a T&P safety valve is required.

**WARNING:**

**Electrical safety.**
To protect against corrosion and ensure compliance with the rules for electrical safety, observe the following points:
- Use metal fittings for potable water heating systems with plastic piping.
- Use only original accessories from the manufacturer.
- When installation of the water heater is complete, inspect and confirm proper ground conductor.

**CAUTION:**

**Maintenance**
- Inspect and maintain the water heater on a yearly basis. Service as needed.
- See chapter 7.1.
- Use only genuine spare parts.

**WARNING:**

**Flooding**
- After a flood, do not use the appliance if any part has been submerged. Damage to appliances that have been submerged can be quite severe and pose numerous safety risks.
- Every appliance that has been submerged must be replaced.

**WARNING:**

**Risk of explosion!**

**For your safety**
- Do not store or use gasoline or other flammable, combustible or corrosive vapors and liquids in the vicinity of this or any other appliance.

**DANGER:**

**Fatal accidents!**
Carbon monoxide poisoning.
- Carefully plan where you install the heater. Correct combustion air supply and flue pipe installation are very important. If a gas appliance is not installed correctly, fatal accidents can result such as carbon monoxide poisoning or fire.

**DANGER:**

Carbon monoxide poisoning.
- Exhaust gas must be vented to outside using approved vent material. See table 5, page 19 (In Canada use only ULCS636 approved material). Vent and combustion air connector piping must be sealed gas-tight to prevent flue gas spillage, carbon monoxide emissions and risk of fire, resulting in severe personal injury or death. Approved vent terminations must be used.
DANGER:
Electric shock!
▶ Field wiring connections and electrical grounding must comply with local codes, or in the absence of local codes, with the latest edition of the National Electric Code, ANSI/NFPA 70, or in Canada, all electrical wiring must comply with the local codes and the Canadian Electrical Code, CSA C22.1 Part 1.

DANGER:
Electric shock!
Shock hazard: line voltage is present.
▶ Before servicing the water heater, unplug power supply cord from outlet. Failure to do so could result in severe personal injury or death.

CAUTION:
Damage to the appliance from over pressure.
▶ The heater must be disconnected from the gas supply piping system during any pressure testing of that system at test pressures equal to or more than 0.5 psi.

NOTICE:
▶ The appliance should be located in an area where leakage of the heater or connections will not result in damage to the area adjacent to the appliance or to lower floors of the structure. When such locations cannot be avoided, it is recommended that a suitable drain pan, adequately drained, be installed under the appliance. The pan must not restrict combustion air flow.

WARNING:
▶ The maximum inlet gas pressure must not exceed the value specified by the manufacturer and the minimum value listed is for the purpose of input adjustment.

NOTICE:
▶ If a water heater is installed in a closed water supply system, such as one having a backflow preventer in the cold water supply line, means shall be provided to control thermal expansion. Contact the water supplier or local plumbing inspector on how to control this situation.

WARNING:
Fire danger!
▶ Keep appliance area clear and free from combustible materials, gasoline and other flammable vapors and liquids.

DANGER:
Risk of CO poisoning!
▶ Do not obstruct the flow of combustion and ventilation air.

WARNING:
Risk of scalding and property damage.
▶ Precautions must be taken prior to manually operating the relief valve to avoid contact with hot water discharged from the relief valve and to prevent water damage.

NOTICE:
Appliance damage!
▶ Label all wires prior to disconnection when servicing controls. Wiring errors can result in improper and dangerous operation. Verify proper operation after servicing.

WARNING:
Relief valve discharges!
▶ If a relief valve discharges periodically, this may be due to thermal expansion in a closed water supply system. Contact the water supplier or local plumbing inspector on how to correct this situation. Do not plug the relief valve.
WARNING:
Personal Injury from toxic chemicals.
▶ Toxic chemicals, such as those used for boiler treatment, shall not be introduced into the potable water used for space heating.

WARNING:
Personal Injury from toxic chemicals.
▶ A water heater which will be used to supply potable water shall not be connected to any heating system or component(s) previously used with a nonpotable water heating appliance.

2 Safety information

The chart below shows the relationship between water temperature and time until there is a risk of scalding. It can be used as the basis for determining the safest water temperature for your application.

<table>
<thead>
<tr>
<th>Temperature (°F)</th>
<th>Time to severe scalding</th>
<th>1)</th>
</tr>
</thead>
<tbody>
<tr>
<td>120 °F (49 °C)</td>
<td>longer than 5 minutes</td>

</tbody>
</table>

Table 2 Approximate time-temperature relationship until there is a risk of scalding

WARNING:
This product can expose you to chemicals including lead, which is known to the State of California to cause cancer and birth defects or other reproductive harm. For more information go to www.P65Warnings.ca.gov

BOSCH water heater complies with the State of California Lead Law (AB1953).

3 Appliance details

3.1 Features
Residential models
- Greentherm T9800 SE residential models
  - maximum temperature 120 °F (49 °C) 1)
Parts
- Color Display with touch controls.
- High power segmented burner with low NOx emissions.
- Modulating gas valve.
- Modulating water valve.
- Active bypass water valve for quick response to changing water flows.

1) Can be reprogrammed to achieve 140 °F (60 °C)
• Burner power segmentation with modulation range from 1:22.

High quality materials for long working life
• Copper primary heat exchanger.
• Stainless Steel 316L condensing heat exchanger.

Features
• Compact space saver: mounts on a wall with a supplied bracket.
• Easily removable one-piece cover.
• On/Off and Temperature touch control.
• Reset function - Long press (> 3 sec.) the ON/OFF button.
• Programmable default temperature.
• Failure codes with message display for easy diagnostics and repair.
• Real-time diagnostics for troubleshooting/informational purposes.
• Built in freeze prevention.
• Integrated siphon to limit condensate freezing in external condensate pipes.

The freeze prevention kit is designed to provide protection for the water heater down to **approximately -4 °F (-20 °C) for short term conditions only.** It will not protect the appliance in areas where the temperature is routinely expected to be below freezing.

Drain the water heater in the event of power outage in freezing conditions.

Accessories (Bosch part #)
• Neutralizer Kit (7738001483)
• Wi-Fi module (7736504944)
• Aquastat kit (7736504584)
• External Recirculation Cable (7736504585)
• Tank loading NTC (7736504583)
• Wired remote control (7736504946)
• Wired remote control with WiFi (7736504945)
• Cascading Kit (7709003962)
### 3.2 Specifications (Technical data)

Table 3

Safety devices
- Flame failure device (flame detection via ionization rod)
- Overheat prevention
- Inlet water temperature sensor
- Outlet water temperature sensor
- Exhaust flue gas temperature sensor
- Water flow sensor
- Air flow sensing technology (Optiflow)
- Scaling detection sensor (HE flue gas temperature sensor)

1) These flow rates are based upon setting the unit to higher temperatures and then mixing down using cold water after the unit.
2) Input rating is based on sea level operation and need not be changed for operation up to 2000 ft (610 m) elevation. For operation at elevations above 2000 ft (610 m), input rating is automatically reduced at the rate of 4 percent for each 1000 ft (305 m) above sea level.
3) When converted to LPG the minimum input is 17 000 BTU/hr (5 kW).
4) With constant flow.
5) Can be reprogrammed to achieve up to 140 °F (60 °C) (see chapter 6.4).
6) Requirements: Steady flows, single unit installations, up to 140 °F (60 °C).
7) To measure Gas Pressure, see Measuring Gas Pressure, chapter 4.13, page 43.
8) Refers to activation point. Deactivation point value is 0.35GPM (1.3 l/min).
9) Protection against water spray.
3.3 Unpacking the heater

The heater is default-set by the manufacturer to operate with Natural Gas, for use with Liquid Propane, follow the conversion instructions in section 6.8.1. Before commissioning the unit be certain you have the heater correctly set for your type of Gas - Propane or Natural Gas. Identification labels are found on the shipping box, and on the rating plate which is located on the left side (when facing appliance front) of the cover.

![Rating plate](image)

**Fig. 2** Rating plate

- [1] Serial number
- [2] Type of gas (Natural gas by default)

3.3.1 The box includes

- Water Heater
- LP Conversion Kit
- Pressure relief valve
- Bracket and screws for wall hanging the heater
- Installation manual (manual can be downloaded at www.boschheatingandcooling.com)

The Greentherm T9800 SE are not approved or designed for:

- Manufactured (mobile) homes, boats or any mobile installation. (Modular homes are acceptable for installation).
- Use above 8000 ft A.S.L. altitude.
- Applications where inlet water temperature is higher than 140 °F (60 °C) for Residential appliances. In these applications a 3 way valve or thermostatic mixing valve must be installed.
- Use with dishwasher pre rinse spray valves.
- Booster applications.

3.3.2 Remove front cover

- Loosen two Phillips head screws located on the bottom of the front cover (fig. 3).

![Loosen two Phillips head screws](image)

In preheated inlet water applications (i.e. solar preheat), activation flow rate will vary depending upon the unit set point, inlet water temperature and the demand flow rate thru the unit. Please consult Bosch for further details to determine if this will function in your application.
Appliance details

1. Slowly open the front cover [1].

Fig. 4  Open front cover

- Disconnect the wire from the HMI (display) [2].
- Lift the front cover to remove from the appliance.
- Install the appliance so that it hangs vertically.

3.4 General rules to follow for safe operation

⚠️ Warning: Safety Rules!

1. You must follow these instructions when you install your heater. In the United States: The installation must conform with local codes or, in the absence of local codes, the National Fuel Gas Code ANSI Z223.1/NFPA 54.

In Canada: The Installation must conform with CSA B149.(1,2) INSTALLATION CODES and/or local installation codes.

2. Carefully plan where you install the heater. Correct combustion air supply and vent pipe installation are very important. If not installed correctly, fatal accidents can occur, such as carbon monoxide poisoning or fire.

3. When the unit is installed indoors with DIRECT VENT (exhaust vent and air intake connected to the outside) it is permitted to be located in bathrooms, bedrooms and occupied rooms that are normally kept closed. See chapter 4.6 (page 18). If the unit will be installed indoors and use indoor combustion air (NON-DIRECT VENT), the place where you install the heater must have enough ventilation. The National Fuel Gas Codes do not allow NON-DIRECT VENT gas fired water heater installations in bathrooms, bedrooms or any occupied rooms normally kept closed. See chapter 4.6 (page 18).

4. You must correctly vent your heater. See chapter 4.6 (page 18) on VENTING.

5. The appliance and its gas connection must be leak tested before placing the appliance in operation. The appliance must be isolated from the gas supply piping system by closing its individual manual gas shutoff valve (not supplied with heater) during any pressure testing at pressures in excess of ½ Psig (3.5 kPa).
6. Keep the water heater area clear and free from combustibles and flammable liquids. Do not locate the heater over any material which might burn.

7. Correct gas pressure is critical for the proper operation of this heater. Gas piping must be sized to provide the required pressure at the maximum output of the heater, while all the other gas appliances are in operation. Check with your local gas supplier, and see the section on connecting the gas supply. See chapter 4.8 (page 33).

8. Should overheating occur or the gas supply fail to shut off, turn off the gas supply at the manual gas shut off valve, on the gas line. Note: manual gas shutoff valve is not supplied with the heater but must be field installed.

9. Do not use this appliance if any part has been underwater. Immediately call the responsible party for the installation of your appliance to inspect the appliance and to replace any part of the water heater which has been underwater.

10. Failure to install the heater correctly may lead to unsafe operation.
3.5 Dimensions

Fig. 5 Dimensions
4 Installation instructions

4.1 Installation tools
The following specialized tools may be required if converting from natural gas to LP:

- Pressure manometer

4.2 Introduction
Please follow these instructions. Failure to follow instructions may result in:

- Damage or injury.

DANGER:

- The water heater must be installed by a qualified installer in accordance with these instructions. If improperly installed, a hazardous condition such as explosion or carbon monoxide poisoning could result. Bosch Thermotechnology Corp. is not responsible for improperly installed appliances.

Common installation practice is to first determine the path and method of venting, then design the piping layout.

4.3 Proper location for installing your heater
Carefully select the location of the water heater. For your safety and for proper heater operation, you must provide combustion air to the heater and properly vent the exhaust gases. Follow the guidelines below:

- 1. Locate the heater where venting, gas and plumbing connections are feasible and convenient.
- 2. The hot water lines should be kept short and insulated to save energy. It is recommended to locate the water heater as close as practical to the most frequently used hot water fixtures.

NOTICE:
Risk of appliance freezing!

- The water in this water heater is cold and always remains cold except for the times the burner is on. In the event of power outage in conjunction with freezing temperatures, the heater should be drained. See chapter 7.2, page 55 “Winterizing” for draining instructions.

NOTICE:
Installation and commissioning

- Do not install the water heater in rooms with a high moisture level (e.g. bathrooms, saunas).
WARNING:
▶ Flammable materials, gasoline, pressurized containers, or any other items or articles that are potential fire hazards must NOT be placed on or adjacent to the heater. The appliance area must be kept free of all combustible materials, gasoline and other flammable vapors and liquids.

WARNING:
Risk of blockage!
▶ Excess of solid particles (e.g. bugs, pollen) in the air intake may clog the air filter and lead to premature failure of the heater if not protected accordingly.
▶ Do not install the water heater in areas where excess of solid particles may accumulate.

4.4 Heater placement and clearances
The water heater design is approved for installation on a combustible wall (see chapter 4.5 Mounting installation) provided the floor covering below the heater is noncombustible.
For installations in an alcove or closet, maintain the minimum clearances to combustible and non-combustible materials. See fig. 6, page 16.

4.5 Hanging appliance on the wall
WARNING:
Severe personal injury and property damage!
Before mounting appliance:
▶ Check that there are no loose or damaged parts inside the appliance.
▶ Set the heater gas type according to the gas supplied to the unit.
▶ Confirm that the water heater has been properly setup for the gas type supplied to the unit. See conversion instructions in section 6.8.1 as needed.

Front cover should be removed (see instructions on page 12) in order to inspect components visually.

WARNING:
▶ Do not install this appliance on a carpeted wall. The heater must be mounted on a wall using appropriate anchoring materials.

NOTICE:
Risk of appliance freezing!
▶ In areas where outside temperature is routinely below 32°F (0 °C) and the heater is to be installed on the inside of an exterior wall, provide a minimum 2" air gap or rigid insulation between the heater back and the wall.

If the wall is sheathed with plaster or drywall, it is recommended that two support boards, either 1"x 4" or 1/2" (minimum) plywood first be attached across a pair of studs, see fig. 7.
▶ Secure the wall mounting bracket provided with the heater to a wall surface. The heater must be kept level on the wall surface, see fig. 8, page 18.
▶ Hang the appliance on the bracket, see fig. 9.

Fig. 7 Distance between support boards
[1] Support boards
Vertical studs are typically 16" (406mm) on center.
**CAUTION:**

Personal injury and property damage.

- Appliance must be installed vertically.

**4.6 Venting**

**DANGER:**

**Risk of CO poisoning!**

- Do not reduce the exhaust or combustion air vent pipe sizes.
- Do not common vent with any other vented appliance or stove.
- Do not use Type-B vent as the actual exhaust vent system for the appliance.

**DANGER:**

**Flue gas poisoning!**

- Failure to vent the exhaust gases to the outside (see table 5 for proper material) may result in dangerous flue gases filling the structure in which it is installed.

**NOTICE:**

- Installations resulting in negative pressure/back draft require sealed combustion (twin pipe / concentric). Damage caused from back draft, i.e. freezing, is not covered by warranty.

**NOTICE:**

**Appliance malfunction!**

- Protect the inlet air supply from leaves and debris by installing a screen on the intake of the termination. A minimum screen mesh size of ¼” is recommended.
- Do not install the water heater in areas where dust and chemicals like hair sprays, spray detergents, chlorine, may accumulate.

**NOTICE:**

- Do not cover non-metallic vent pipe and fittings with thermal insulation.
Flue temperature:

- To prevent the risk of flue material overheat the appliance’s flue temperature is sensed and is limited. The flue temperature limit is dependent on inlet water temperature.
- **Residential models**: Maximum flue temperature is limited to 145 °F (63 °C).

### 4.6.1 Vent options

This appliance can be installed as direct vent or Category IV. The Greentherm T9800 SE is approved with the following venting options:

<table>

**Table 5  Approved vent materials**

For specific questions concerning vent material, specifications, usage or installation, please contact the vent manufacturer directly.

Approved Vent Manufacturers;

- M&G
- Centrotherm
- IPEX
- Royal Plastics
- Eccovent
- Charlotte
- Z-Flex

Do not use cellular foam core pipe for exhaust. Approved for intake only.

The vent connection for the appliance is secured with a clamp on the appliance exhaust adapter. All other vent connections must be glued, except PP and flex PP. Slide the vent pipe into the exhaust adapter. The exhaust pipe must be properly supported and must be pitched a minimum of a ¼ inch per foot back to the appliance. This allows the condensate to drain properly.

Maximum vent lengths and equivalent lengths per table 8 apply.

*Table 7  Approved PP Vent Components & Terminations*
4.6.3 Vent specifications
Establish vent clearances that comply with the vent manufacturer's specifications and all applicable national/local codes.

Minimum combustion air and exhaust pipe length
The minimum exhaust pipe length is 1 ft (0.3m) of straight vent pipe. The minimum air intake pipe length is 1 ft or one 90° elbow or an air intake grill cap to prevent debris from falling into the appliance.

Maximum combustion air and exhaust pipe length
The table 8 displays the maximum allowable straight pipe lengths for air intake and exhaust piping. Reduce the maximum allowable pipe length by the equivalent lengths for each elbow used and termination used.

PROPER GAS PRESSURE!
The following section assumes the water heater will receive gas pressure greater than or equal to 5" WC for the 199kBTU models (4" WC for 160kBTU models). In cases of gas pressure below 5" WC for the 199kBTU (4" WC for the 160kBTU models) the maximum heat input is reduced.

Improper gas pressure or vent length may result in undesired symptoms or errors such as noisy burner, C1, C2, CF, EA, EC.

The vent for this appliance shall not terminate:
1. over public walkways; or
2. near soffit vents or crawl space vents or other areas where condensate or vapor could create a nuisance or hazard or cause papery damage; or
3. where condensate vapor could cause damage or could be detrimental to the operation of regulators, relief valves, or other equipment.

The values of maximum flue length in table 8 are before any deductions for elbows or terminations.

<table>
<thead>
<tr>
<th>Venting</th>
<th>Max equivalent Exhaust length</th>
<th>Max equivalent Intake length</th>
</tr>
</thead>
<tbody>
<tr>
<td>2&quot; Twin pipe</td>
<td>60ft (1)</td>
<td>60ft</td>
</tr>
<tr>
<td>3&quot; Twin pipe</td>
<td>280ft (1)</td>
<td>280ft</td>
</tr>
<tr>
<td>2&quot; / 4&quot; Concentric pipe</td>
<td>60ft (1)</td>
<td></td>
</tr>
<tr>
<td>3&quot; / 5&quot; Concentric pipe</td>
<td>280ft (1)</td>
<td></td>
</tr>
</tbody>
</table>

1) To assure maximum heat input at maximum vent length minimum gas pressure should be 5" W.C. for the 199 kBTU models and 4" W.C. for the 160 kBTU models.

4) The 12 inches (30cm) is directly above grade level.
3) A vent shall not terminate directly above a sidewalk or paved driveway that is located between two single family dwellings and serves both dwellings.

4) Permitted only if veranda, porch, deck or balcony is fully open on a minimum of two sides beneath the floor.

Table 10

[*] Clearance in accordance with local installation codes and the requirements of the gas supplier.
4.6.4 Recommended Vent Configuration Examples

Below are approved examples of vertical and horizontal venting installations.

**NOTICE:**

Using a single pipe vent in cold climates puts the water heater at risk of freezing, as negative air pressure is common in buildings during cold weather. This situation will pull cold air through the heat exchanger and can lead to damage and a water leak and is not covered by the product's warranty. In the event of negative air pressure causing back drafting contact Bosch for information.

*Fig. 12  Horizontal venting system (concentric vent)*

1. Exhaust
2. Air intake
3. Concentric Vent kit
4. Exhaust pipe
5. Air Intake pipe

[LA] Minimum 1"

*Fig. 13  Vertical venting system*

[A] 12 inches (305 mm) (18 in. for Canada) above maximum snow level or at least 24 inches (610 mm), whichever is greater.

[B] 12 inches (305 mm)

[C] 12 inches (305 mm) minimum above air intake opening

*Fig. 14  Horizontal parallel venting system (twin pipe)*

[A] 3ft minimum

Vent terminals are at the same height.
**Installation instructions**

**Fig. 15** Horizontal venting installation (air intake piping not shown)

1. Termination
2. Water heater
3. Elbow
4. Horizontal run should slope ¼" per foot upwards to water heater.

[LA] 12 inches (305 mm) (18 in. for Canada) above maximum snow level or at least 24 inches (610 mm), whichever is greater.

**NOTICE:**

- The venting system must be installed in accordance with the vent system manufacturer’s instructions.
- In case vent system manufacturer instructions are not provided, it is recommended to place pipe supports every 5 feet on horizontal runs, beginning with support near water heater.
- Periodic cleaning of the vent terminal air intake screen is mandatory.
- Avoid locating vent terminals near equipment, vegetation, plants or building features which can be subject to degradation from exhaust gases.

**Fig. 16** Horizontal venting system (sealed combustion)

1. Intake
2. Exhaust

**Fig. 17** Vent and air intake pipe position of a sealed combustion system

1. Intake
2. Exhaust
[X] At least 1 foot (305 mm)
With Flex Pipe the maximum length is reduced by 60%, (applies only to the section in flex PP). Example: 10 feet of flex PP is equivalent to 25 feet of rigid PP. Flex Pipe according to the suppliers instructions is for use in the vertical part of the installation only.

### 4.6.5 Connecting the condensate water drain

**NOTICE:**

**Risk of condensate pipe freezing!**

- Do not install condensate drain tubing in areas where it may freeze.

#### Appliance condensate drain installation

The appliance comes equipped with an internal condensate drain and siphon. This drains condensation formed in the secondary heat exchanger. Piping must be installed under the condensate drain outlet on the water heater and piped for disposal in accordance with local codes.

To install the condensate drain, connect a ¾” NPT adapter on the water heater.

#### Installing an additional breather downstream in not necessary since this function is already included in the heater.
NOTICE:

A blocked breather may cause an undesired double-siphon effect.
▶ Ensure that the breather included in the siphon is not obstructed to allow correct function.

Verify condensate disposal/neutralization is in accordance with federal, State, and local regulation.

This is a high efficiency appliance, condensate flow can be as much as 2.1 gal/hr at full power.

4.6.6 Backdraft reducer
The backdraft reducer (9301BFP) is the preferred option for limiting backdraft (see fig. 21).

The backdraft reducer (9301BFP) is sized for 3" diameter PVC.

It is possible to use Backdraft reducer (9301BFP) for 2" installations.
This requires 2" to 3" adapters.

Installation
For this backdraft reducer to be effective, the internal flapper must be 100% closed when the water heater is not running.

Refer to fig. 23 for preferred installation positions in the vent system.

Installation requirements:
▶ Install the damper per the supplied manufacturer’s instructions.
The damper is only to be used in the exhaust vent piping.
▶ Ensure directional arrow on damper label faces in the same direction as exhaust flow.
▶ If installed horizontally, the axis must be horizontal or slightly pitched up towards termination to ensure damper closes 100% when heater is not running.
▶ To allow accessibility, the damper must not be installed in an enclosed section of vent pipe.
▶ Do not install the damper in unconditioned spaces (e.g. attics) Condensation can build up while the heater is running which can later freeze and potentially block the flapper.
4.6.7 Single Pipe Venting

**NOTICE:**

▶ Single pipe venting not recommended in cold climates.
▶ Installations resulting in negative pressure/back draft require sealed combustion (twin pipe / concentric). Damage caused from back draft, ie. freezing, are not covered by warranty.

**NOTICE:**

▶ When installed in an environment where corrosive chemicals or dirty air (e.g. hair salons, car washes) are present the sealed combustion (twin pipe or concentric) is required.

Air combustion

**WARNING:**

Risk of CO poisoning!

The lack of adequate air openings may lead to improper operation due to other appliances consuming required air.

▶ Always follow local codes and regulations of authority having jurisdiction in case of single pipe installation in confined spaces.

Although it is permissible to draw the air-intake from the inside, it is not the manufacturer’s recommended installation method. When drawing inside air, install a 90° elbow or air intake screen on the top of the air-intake inlet adaptor to prevent foreign objects from falling into the unit.

If a single pipe installation is utilized, follow guidelines below for providing adequate combustion air for the water heater as well as any other appliances that may consume air in the same space. Always follow local codes and regulations of the authority having jurisdiction.

- **Appliances located in unconfined spaces:**
  - a) An unconfined space is one whose volume is greater than 50 cubic feet (1.42 cubic meter) per 1000 BTU/hr (292.81 Watts) of the combined rating of all appliances installed in the space. That would be 9950 cubic feet (281.8 cubic meters) or 1243 square feet with 8 foot ceiling, for a single 199 kBTU water heater.
  - b) In unconfined spaces in buildings of conventional frame, masonry, or metal construction, infiltration air is normally adequate to provide air for combustion.

- **Appliances located in confined spaces:**
  The confined space must be provided with two permanent openings, one commencing within 12 inches (304.8mm) of the top and one commencing within 12 inches (304.8mm) of the bottom of the enclosure. Each opening must have a minimum free area of one square inch per:
    - 1000 BTU/hr (292.81 Watts) if all air is taken from inside the building
    - 2000 BTU/hr (585.62 Watts) if all air is taken from the outside by horizontal ducts
    - 4000 BTU/hr (1171.24 Watts) if all air is taken from the outside by direct openings or vertical ducts

Or the confined space must be provided with one permanent opening or duct that is within 12 inches (304.8mm) of the ceiling of the enclosure. This opening must have a minimum free area of one square inch per:
    - 3000 BTU/hr (878.43 Watts) if all air is taken from the outside by a direct opening or vertical duct.

Louvers, grills and screens have a blocking effect, when used, increase the sizes of your openings by 300% for wood louvers (as wood type will reduce the free air by 75%) and 43% for metal louvers (as metal will reduce the free air by 30%). Refer to the National Fuel Gas Code for complete information.

4.7 Factory settings

The appliances are supplied having been set in the factory for the values shown on the rating plate for natural gas. For any other adjustments see chapter 6.8.

4.7.1 Natural gas

The appliances must not be operated if the dynamic gas pressure is less than 3.5" WC or greater than 10.5" WC.

4.7.2 Liquid propane gas (after gas conversion)

The appliances must not be operated if the dynamic gas pressure is less than 8" WC or greater than 13" WC.

If gas conversion is needed (Natural Gas to Liquid propane gas), see section 6.8.

1) To assure maximum heat input at maximum vent length minimum gas pressure should be 5" W.C. for the 199 kBTU models and 4" W.C. for the 160 kBTU models. For more information see section 4.6.3.
WARNING:
▶ The gas type conversion must only be carried out by a qualified contractor.

4.8 Gas piping & connections
Before connecting the gas supply, be sure that the heater is set for the same gas to which it will be connected.
In the United States: The installation must conform with local codes or, in the absence of local codes, the National Fuel Gas Code ANSI Z223.1/NFPA 54.
In Canada: The installation must conform to CSA B149 INSTALLATION CODES and/or local installation codes.

DANGER:
Explosion hazard!
▶ DO NOT connect to an unregulated or high pressure propane line or to a high pressure commercial natural gas line.

GAS CONNECTIONS
▶ Install a manual gas shut off valve on the gas supply line within easy reach of the appliance.
▶ Install a union when connecting the gas supply.
▶ Gas connection to the water heater is ¾” NPT. See chapter 4.8.1 for the minimum internal pipe diameter required.
▶ Undersized flexible appliance connector is not permitted.
▶ National Fuel Gas Code requires that a sediment trap (drip leg) be installed on gas appliances not so equipped. The drip leg must be accessible and not subject to freezing conditions. Install in accordance with the recommendations of the serving gas supplier, see fig. 25. Once connections are made, check for gas leaks at all joints.
Apply some gas leak detection solution to all gas fittings. Bubbles are a sign of a leak. A combustible gas detector may also be used to detect for leaks.

DANGER:
Explosion hazard!
▶ If you detect a gas leak, shut off the gas and ventilate the room (open windows, doors). Tighten appropriate fittings to stop leak. Turn the gas on and check again with a gas leak detection solution. Never test for gas leaks using a match or flame.
**GAS LINE SIZING**

The gas supply piping for a single heater should be sized for a maximum draw of 199000 BTU/hr for Greentherm T9800 SE/SEC 199. Measure the length of the gas supply line from the building’s gas main to the heater and use the chapter 4.8.1 and 4.8.2 or the gas line manufacturer’s sizing tables to determine the pipe diameter necessary. If there are more gas appliances on the line, size the gas line according to the total maximum amount of BTU draw input rating of for all appliances combined.

**Note:** Undersizing the gas line may result in diminished hot water flow rate and temperature, or improper appliance operation (noise and combustion instabilities). See chapter 4.13, page 43 for the procedure to measure gas pressure. Proper gas pressure must be confirmed at time of installation.
4.8.1 Gas Line Sizing Tables for NATURAL GAS

For your convenience, see below for an excerpt from gas line sizing tables for a single NG appliance. For details, see the current NFPA 54.

Required input for 160000 / 199000 BTU/hr for the Greentherm T9800 SE. The gas supply system must be sized for the combined total maximum BTU/hr load requirements of all gas appliances running simultaneously.

The tables below show the maximum capacity of the gas supply pipe in cubic feet per hour. Please contact your local gas supplier for the energy content of the gas to determine the BTU/hr capacity. Use 1,000 BTU/cubic foot for rough estimations.

**Nominal Iron Pipe Size, inches** | **Internal Diameter inches** | **Length of Black Iron Pipe \(\text{(Schedule 40 Metallic Pipe)}\), Feet** | **Nominal Iron Pipe Size, inches** | **Internal Diameter inches** | **Length of Black Iron Pipe \(\text{(Schedule 40 Metallic Pipe)}\), Feet** | **Nominal Iron Pipe Size, inches** | **Internal Diameter inches** | **Length of Black Iron Pipe \(\text{(Schedule 40 Metallic Pipe)}\), Feet** | **Nominal Iron Pipe Size, inches** | **Internal Diameter inches** | **Length of Black Iron Pipe \(\text{(Schedule 40 Metallic Pipe)}\), Feet**
--- | --- | --- | --- | --- | --- | --- | --- | --- | --- | --- | ---

1 | 1.049 | 678 | 466 | 374 | 320 | 284 | 257 | 237 | 220 | 207 | 195

*EHD = Equivalent Hydraulic Diameter. The greater the value of EHD, the greater the gas capacity of the tubing.*

**Initial Supply Pressure of 8.0” w.c. or Greater**

--- | --- | --- | --- | --- | --- | --- | --- | --- | --- | --- | ---
\(\frac{3}{4}\) | 0.622 | 454 | 312 | 250 | 214 | 190 | 172 | 158 | 147 | 138 | 131
\(\frac{3}{4}\) | 0.824 | 949 | 652 | 524 | 448 | 397 | 360 | 331 | 308 | 289 | 273
1 | 1.049 | 1790 | 1230 | 986 | 844 | 748 | 678 | 624 | 580 | 544 | 514

**Initial Supply Pressure of 8.0” w.c. or Greater**

| Length of Corrugated Stainless Steel Tubing (CSST), Feet | EHD* | 10 | 20 | 30 | 40 | 50 | 60 | 70 | 80 | 90 | 100
--- | --- | --- | --- | --- | --- | --- | --- | --- | --- | --- | ---
30 | 828 | 580 | 471 | 407 | 363 | 330 | 305 | 285 | 268 | 251
31 | 958 | 672 | 546 | 471 | 421 | 383 | 331 | 311 | 295
37 | 1,530 | 1,090 | 895 | 778 | 698 | 639 | 593 | 555 | 524 | 498

*EHD = Equivalent Hydraulic Diameter. The greater the value of EHD, the greater the gas capacity of the tubing.*
4.8.2 Gas Line Sizing Tables for LP GAS

For your convenience, see below for an excerpt from gas line sizing tables for a single LP appliance. Their intended use is for pipe sizing between the 2nd stage (low pressure) regulator and the appliance. For details, see the current NFPA 54 or NFPA 58.

Required input for 160000 / 199000 BTU/hr for the Greentherm T9800 SE. The gas supply system must be sized for the combined total maximum BTU/hr load requirements of all gas appliances running simultaneously.

**Pipe Sizing Between Single- or Second-Stage (Low-Pressure) Regulator and Appliance**

4.9 Water quality

Water quality can have an impact on appliance longevity. Water supplied to the Greentherm T9800 SE must be in accordance with table 17 and fig. 26.

For water analysis data call your local water department, or if on a well, have well water analyzed periodically. Heavy scale will form if the combination of water total hardness and pH exceeds the values specified in fig. 26 (grey area). Bosch recommends consulting a local water treatment professional for water softening/conditioning options.

### Table 17

<table>
<thead>
<tr>
<th>Description</th>
<th>Max. Levels</th>
</tr>
</thead>
<tbody>
<tr>
<td>pH</td>
<td>pH 6.5 - 8.5</td>
</tr>

</tr>
</tbody>
</table>

1. Total Harness and pH maximum values must be evaluated in combination. Indicated maximum values will be reduced according to fig. 26.
2. Combined values of total hardness and pH must be under the indicated grey area. (e.g. the pair [180;8.3] [total hardness; pH] is not acceptable).

### Connecting the pressure relief valve (PRV)

A pressure relief valve is included in the box and must be installed at the time of installation. No valve is to be placed between the PRV and the heater. No reducing coupling or other restriction may be installed in the discharge line. The discharge line must be a minimum of 4” above a drain and installed such that it allows complete drainage of both the PRV and the line. The discharge line must be placed where it will not cause any damage.

- Use the integrated port to install the PRV, see Fig. 27 [1].
- Tighten the PRV with the support of a wrench, see Fig. 27.
- Support all piping.

### 4.10 Water connections

Water connections are on top ONLY.
Bottom connections are drain/service ports with limited flow capacity.
NOTICE:

- This heater is not approved for preheated water applications exceeding 140 °F (60 °C) for Residential appliances, in these cases use a 3-way valve or mixing valve must be installed before the appliance to prevent water exceeding 140 °F (60 °C) for Residential appliances, from entering the appliance.

- When facing the heater, the ¾" cold connection is on the top right and the hot connection is on the top left.
- Tighten all water connections with the support of a wrench, see Fig. 28.

Fig. 28

1. Cold connection
2. Hot connection

CAUTION:
Appliance damage!
Appliance will overheat if not filled with water.
- Ensure that the appliance is filled with water by opening a hot water faucet, before plug in the water heater to the power supply.

Fig. 29 Water filter

1. Cap
2. Water filter

CAUTION:
- The use of unions when connecting to the inlet and outlet connections is recommended. This will facilitate any necessary servicing.
- Plastic or PEX type plumbing materials are not suitable for connecting directly to or within 18" of the water heater.
- Although water piping throughout the building may not be copper, we require that copper or suitably rated stainless steel flex line be used for the water connections for 18" on either side of the water heater (follow local codes if more stringent).
- Never sweat any piping directly to water connections, as damage will occur.
- Keep water inlet and outlet pipes to no less than ¾" diameter to allow the full flow capacity.
- If the cold and hot connections to the heater are reversed, the heater will not function.
- Be certain there are no loose particles or dirt in the piping. Blow out or flush the lines before connecting to the water heater.
- Full port shutoff valves should be installed on both the cold water supply and hot water outlet lines to facilitate servicing the heater (see fig. 27).
- For installation on a private well system with a pressure tank, the lowest pressure range setting recommended is 30-45 psi (2.06 - 3.1bar) to ensure optimal performance.
4.11 Domestic hot water recirculation with external pump

The following drawing is provided to illustrate one possible recirculation design. This schematic is for illustration only and must not be used for actual installation without appropriate engineering and technical advice from a properly licensed professional in the locality where the installation is made.

This appliance has been designed to activate recirculation by controlling an external pump. For this function, the external pump must be powered by an external electrical source and can be switched on and off using the Bosch cable accessory (7736504585). All the features of recirculation (→ 6.5.2, A1 Recirculation) can be used.

![Recirculation application with a dedicated return line](image)

Fig. 30 Recirculation application with a dedicated return line

3. Expansion tank, field supplied
4. Circulator pump, field supplied
5. Circulator cable accessory
6. Greentherm T9800 SE / SEC
7. PRV
8. Shutoff valves, field supplied
9. Cross-over valve, field supplied

Recirculation application showed in fig. 31 is for Greentherm T9800 SE model only. Models with a built-in pump cannot be used.

4.11.1 Recirculation options

**House Recirculation**

This recirculation option uses the appliance's NTC sensor along with the option to schedule and control the pump (only with remote control - part numbers 7736504946 and 7736504945).

**Tank loading**

This recirculation option gives the option of using one of three temperature sensors to control the recirculation option. The scheduling option is not available for tank loading, except for commercial models.

- **External NTC - 7 736 504 583**
  - Only compatible with Bosch cable/sensor accessory (7736504583).
• **Aquastat - 7 736 504 584**
  - The aquastat connector kit (7736504584) must be used to connect a field supplied aquastat to the appliance.

• **Internal NTC**
  - Uses the appliance's NTC sensor to measure the incoming water temperature.

### 4.12 Space heating applications

**DANGER:**

**Risk of scalding!**

- If the set point temperature is above 120°F (49 °C), precautions should be taken to protect users of potable water from scalding.

**NOTICE:**

- The use of a flow switch is recommended to ensure DHW priority and to prevent “cold-blow” situations when the Bosch tankless water heater is used with an air handler. Air handler installation must include a pump. The flow switch should be used to disable the blower on the air-handling system when domestic water is used.

**NOTICE:**

- Ensure the primary pump is properly sized to provide adequate flow for the system heat load.

For external pump sizing please refer to the pressure drop curves, fig. 33. Also remember to account for system piping pressure loss. A minimum of 1.7 GPM is recommended to provide adequate flow through the water heater when determining the size of the primary pump.

**Greentherm T9800 SE tankless water heaters are approved for use in combination DHW and space heating applications (open loop setup).**

These water heaters are not approved for use in space heating only applications (closed-loop setup). Bosch supports applications of combination DHW and space heating in an open loop configuration if plumbed similar to Fig. 32. Please see warranty document for additional details.

Fig. 33  Pressure drop curve
4.13 Measuring gas pressure

4.13.1 Gas supply pressure
Confirms gas pressure upon installation.

Connecting manometer

- Shut off gas supply at installer supplied shutoff valve for this water heater.
- Locate the inlet gas pressure test port (see Fig. 34).
- Loosen the screw inside test port fitting (do not remove) and connect the manometer tube to the test port (see Fig. 34).

Static Pressure Test

- Turn the gas supply back on.
- Record the static gas pressure reading in table 19.

Dynamic Pressure Test

- Turn ON the appliance.
- Access menu P1 Max. Power, see section 6.6.

Note: While in this mode the appliance will run constantly at maximum power and allow maximum water flow.

For inlet gas pressure adjustment consider the following table:

<table>
<thead>
<tr>
<th>Gas type</th>
<th>NG</th>
<th>LPG</th>
</tr>
</thead>
<tbody>
<tr>
<td>Inlet Gas Pressure</td>
<td>3.5&quot; WC&lt;sup&gt;1)&lt;/sup&gt;</td>
<td>8&quot; WC</td>
</tr>
</tbody>
</table>

1) To assure maximum heat input at maximum vent length, the minimum gas pressure should be 5" W.C. for the 199 kBTU models and 4" W.C. for the 160 kBTU models. For more information see section 4.6.3.

Table 18 Minimum inlet gas pressure under full operation

- Operate all other gas appliances (except heater) on the same gas piping system at maximum output.
- Open all hot water faucets to achieve a flow rate of at least 6 gallons per minute (1 tub and 2 sinks should be sufficient). If heater goes back to P2, open more hot water fixtures to allow sufficient flow to keep the water heater in P1.
- Record the lowest operating gas pressure reading in table 19.
- Turn OFF the appliance.
- Shut off gas supply.
- Disconnect the manometer tube from the test point.
- Tighten the screw inside test point fitting.

Depending on the vent length, gas pressures below 5" W.C. for Natural Gas or 8" W.C. for LPG may result in reduced power output or possible error codes and must be corrected. See Gas Connections, chapter 4.8, page 33.

5 Electrical connections

5.1 Electrical power supply

⚠️ DANGER:
Risk of electrocution!

- For safety reasons, disconnect the power supply cord to the water heater before any service or testing is performed.

⚠️ DANGER:

- This water heater must be electrically grounded in accordance with the most recent edition of the National Electrical Code, NFPA 70. In Canada, all electrical wiring to the heater must be in accordance with local codes and the Canadian Electrical Code, CSA C22.1 Part 1. Do not rely on the gas or water piping to ground the metal parts of the heater.

⚠️ WARNING:

- Modification or tampering with the power supply cord is prohibited.
- Use of extension cords is prohibited.

The water heater requires an electrical power supply from a 120VAC / 60Hz properly rated receptacle and must be properly grounded.
The water heater is wired as shown in the wiring diagram (chapter 10, Fig. 64).

Fig. 35 Connecting power supply cord

[1] Power cord length: 5.9 ft (1.8m).

Note: The power supply that the appliance is plugged into should be isolated from possible water damage. Observe proper clearance to avoid damages.

5.2 Position of the fuses in control unit

To check the fuse, proceed as follows:

▶ Disconnect the appliance from the power supply before removing the front cover.
▶ Remove the front cover, see fig. 3, page 12.
▶ Disconnect all the cables from the control unit.
▶ Press the four snaps of the control unit and remove the cover.

▶ Check the fuse on the printed circuit board, for electrical continuity, see fig. 37, [1].

Fig. 37 Fuse position

[1] Fuse
▶ After checking the fuse, reinstall all parts in reverse order.

6 Operating Instructions

Fig. 38 Touch control display

[1] LCD display
[2] Up button
[3] Down button
[4] On/Off button
[5] Confirmation button
[6] Return button
[7] Burner status / Error symbol

NOTICE:

Instruction to clean display

▶ Wipe down with a damp cloth. Do not use any aggressive or corrosive cleaning agents to clean the display.
6.1 For your safety read before operating your water heater

**WARNING:**

Explosion hazard!

- If you do not follow these instructions exactly, a fire or explosion may result causing property damage, personal injury or loss of life.

**NOTICE:**

Appliance malfunction

Strong magnetic fields can interfere with the electronics, which can lead to appliance malfunction.

- Do not attach magnets to this water heater, neither install it near strong magnetic fields.

A. This appliance is equipped with electronic ignition for lighting the main burner. When turning the heater on, if you smell gas or detect a gas leak, follow these instructions exactly.

**WHAT TO DO IF YOU SMELL GAS,**

**DANGER:**

Risk of explosion!

- Turn off the gas shut-off valve.
- Open windows and doors.
- Do not try to ignite the appliance.
- Do not touch any electrical switch, telephone, and do not use outlets.
- Extinguish all open flames. Do not smoke! Do not use lighters!
- Warn all occupants of the building. Do not ring doorbells!
- If you can hear gas leaking, leave the building immediately.
- Prevent others from entering the building and notify the police and fire department from outside the building.
- From outside the building, call the gas utility company and a trained and certified installer.

B. Use only your hand to press the on/off control button. Never use tools. If the touch control display is dirty, wipe down with a damp cloth. Forceful repair may result in a fire or explosion.

C. Do not use this appliance if any part has been under water. Immediately call a qualified service technician to inspect the appliance and to replace any part of the control system and any gas control which has been under water.

6.2 Power

To turn ON the appliance;

- Touch and hold symbol for more than 3 sec. The LCD display shows the selected temperature. When the burner is on, the display shows symbol (Fig. 38, [7]).

6.3 Error code reset

Some possible faults can be solved by resetting the appliance.

To remove an error code from the display,

- Touch and hold symbol for more than 3sec. The appliance will initiate the start up sequence.

**NOTICE:**

Appliance malfunction!

- If the problem persists, contact your qualified contractor.

6.4 Temperature selection

To select a hot water temperature:

- Touch the symbol or until the desired temperature is displayed.
To increase setpoint temperature limit of the appliance,
▶ Access the menu **LM - Temperature Limited** (→
Section 6.6) and select **Unlocked**.

A lower temperature set point will reduce the risk of scalding,
reduce energy consumption and increase the longevity of the
heat exchanger.

---

### 6.4.1 Programming the default setpoint temperature

![Fig. 42 “Program” key](image)

▶ Touch the symbol ↑ or ↓ to select the desired
temperature.
▶ Hold the “OK” button for 3 seconds to save the default set
point temperature.

When the display stops blinking, the default set point
temperature is saved in memory.

**Selecting the default setpoint temperature**

In order to select the default setpoint temperature
▶ Touch the “OK” button.

Display shows the default setpoint temperature, which is now
the hot water selected setpoint-temperature.

### 6.4.2 Solar Mode

If the appliance does not ignite, it means that the desired set
temperature would be exceeded even running at minimum BTU.
In this condition, the solar mode indicator will show on the
display.

In most cases, solar mode is activated if the inlet water
temperature exceeds the set point temperature minus 1 °F
(0.5 °C).

**Solar mode/warm inlet temperature activation formula**

| Temp. inlet ≥ [Temp. set - 1 °F (0.5 °C)] |

Ex.: 111 °F (43.9 °C) ≥ [112 °F (44.4 °C) - 1 °F (0.5 °C)]

---

**Setting the water temperature**

The desired temperature of hot water can be adjusted on the
front control panel of the heater.

The water heater has an electronically controlled gas valve that
modulates the burner input in response to both varying hot
water flow rates and/or changes in any incoming and outgoing
water temperatures.
6.5 Information / Adjustments menu

Access to Information / Adjustments menu
Display shows the set point temperature.
▶ Touch the symbol .
Display shows P4 Information.
▶ Touch symbols or to scroll through the available menus.

Available menus

Table 21

6.5.1 “P4” - Information

This menu provides access to several parameters.
▶ Access to information / adjustments menu.
Display shows P4 Information.
▶ Touch the symbol ok .
Display shows DH Data History.
▶ Touch the symbols or to choose the following information.
  - DH Data History
  - OD Operation Data
  - FH Failure History
  - AC Consumptions
  - HS About
▶ Touch the symbol ok to selected the desired information.

DH Data History
Allows you to view two parameters:
  - Operation Cycles - number of times burner has been started.
  - Operation Hours - number of hours burner has been operational.

OD Operation Data
Allows you to view various parameters of the current operation of the appliance:
  - Hex Out NTC - current water temperature at heat exchanger outlet.
  - Inlet NTC - current temperature of the temperature sensor of the water inlet tube.
  - Outlet NTC - current temperature of the temperature sensor of the water outlet pipe.
  - Air Pressure - current box pressure (mbar or psi x100).
  - Fan Speed - current fan speed.
  - Water Flow - total flow, through main valve + bypass.
  - Ambient NTC - current temperature inside cabinet near the fan.
  - Exhaust Gas NTC - Exhaust flue gases temperature sensor.
  - SS Hex NTC - Flue gases temperature sensor at the condensing unit inlet (between heat exchangers).
  - Ambient NTC - current temperature inside cabinet near the fan.
  - External Tank - current temperature on the external tank.
  - Barometric pressure - current barometric pressure at installation location.
  - ION - current ionization value.

FH Failure History
Allows you to view the last 10 error codes.
▶ Touch the symbol ok .
Display shows the last 10 error codes.
If the display shows ellipsis (…) means that no error as occurred.
▶ Touch symbols or to navigate between errors.
▶ Touch the symbol ok to see the date and hour when the error occurred.
▶ Touch the symbol to return to main menu.

AC Consumption
Allows for displaying, in graphic form, the consumption of gas and water for the last 5 operations longer than 1 minute.

HS About
Allows you to view the versions of software / hardware installed on the water heater.

6.5.2 SA - Settings
Only to be use when domestic recirculation is installed.
Fig. 44  SA - Settings

This menu provide access to several parameters.

▶ Access to information / adjustments menu.
   Display shows P4 Information.
▶ Touch the symbol until the display shows SA Settings.
▶ Touch the symbol .
   Display shows A0 Clock/Date.
▶ Use the symbols or to scroll through the information/adjustments menus.
   – A0 Clock/Date
   – A1 Recirculation
   – A2 Vacations
   – A3 Language
   – A6 Display Position
   – A7 Wireless Connectivity
   – A8 Startup Delay
   – A9 Units Set
   – AA Display Timeout
   – AC Lock Display
▶ Touch the symbol to select the desired information.

A0 Clock/Date

Set the Time:
▶ Touch the symbol .
   Display shows Clock and Date menu.
▶ Touch the symbol to set the Clock.
▶ Use the symbols or to set the hours.
▶ Touch the symbol when hour is correct.
▶ Use the symbols or to set the minutes.
▶ Touch the symbol when minutes are correct.
▶ Use the symbols or to choose a.m. or p.m.
▶ Touch the symbol to exit the Clock menu.

Set the Date:
▶ Use the symbols or to choose the Date menu.
   Display shows Date menu: MM / DD / YYYY.
▶ Touch the symbol .
▶ Use the symbols or to set the month.
▶ Touch the symbol when month is correct.
▶ Use the symbols or to set the day.
▶ Touch the symbol when the day is correct.
▶ Use the symbols or to set the year.
▶ Touch the symbol when the year is correct.
▶ Touch the symbol to exit the Date menu.
   Clock and Date are defined.
▶ Touch the symbol , the Clock and Date blink 3 times and exit menu.

A1 Recirculation

Choosing a recirculation program:
▶ Use the symbols or to scroll through the options.
   – HR House Recirculation
   – TL Tank Loading
   – OFF Off
HR House Recirculation
• AA Always Active
• SCH Schedule

AA Always Active

Set the AA Always Active:
▶ Touch the symbol to select ON.
   Recirculation will be always active.

SCH Schedule

Creating a SCH Schedule:
▶ Touch the symbol , to select Schedule.
   Display shows week days.
▶ Use the symbols or to select the desired week day.
   Press ok ,
   Use the symbols or to choose option Add New.
▶ Touch the symbol , to enter the recirculation program.
▶ Use the symbols or to choose the beginning hour.
▶ Touch the symbol , to set the beginning hour.
▶ Use the symbols to choose the end hour.
   A recirculation period is defined.
   The user can add additional recirculation periods on the same day.
▶ Touch the symbol , to select Add New and repeat all steps mentioned above.
Copy recirculation program,
   The user can copy the recirculation period(s) to other week days.
Use the symbols ▲ or ▼ to select the day of the week to be copied.
Use the symbols ▲ or ▼ to choose option Copy to.
Touch the symbol [ok] to select the day of the week.
Display shows week days.
Touch the symbol [ok] to select the day of the week.
Use the symbols ▲ or ▼ to choose another week day.
When week days are selected,
Touch the symbol ◀ to validate operation.
Touch the symbol ◁ to exit.

Deleting a recirculation program,
Use the symbols ▲ or ▼ to select the day of the week to be deleted.
Touch the symbol [ok].
Use the symbols ▲ or ▼ to choose option Delete.
Touch the symbol [ok].
Use the symbols ▲ or ▼ to choose a recirculation period.
Touch the symbol [ok] twice to delete recirculation period.
Touch the symbol ◁ to exit.

TL Tank Loading
Touch the symbol [ok].
Display shows following menu.
- External NTC
- Internal NTC
- Aquastat
Select the menu according with the installation.

OFF
Set the OFF:
Touch the symbol [ok], to select OFF.
Recirculation will not be active.

A2 Vacations
Set Vacation time.

The burner will not activate while the appliance is in vacation mode.

Touch the symbol [ok].
Display shows Vacation menu.
Use the symbol ▼ to choose On.
On starts to blink.
Touch the symbol [ok] to define first day of vacation: MM/DD/YYYY.
Use the symbols ▲ or ▼ to set the month.
Operating Instructions

▶ Touch the symbol \textbf{ok} .
Display shows \textit{Startup Value(s)}.  
▶ Touch the symbol \textbf{ok}.  
▶ Touch the symbols \(\uparrow\) or \(\downarrow\) to define, in seconds, the delay to start-up after detection of the water flow.  
▶ Touch the symbol \textbf{ok} after reaching the desired value.  

\textbf{A9 Units Set}  
This menu allows you to choose the units visible on the display.  
▶ Access to information / adjustments menu.  
Display shows \textit{SA Settings}.  
▶ Touch the symbol \(\uparrow\) until \textbf{A9 Units is in the display}.  
▶ Touch the symbol \textbf{ok}.  
▶ Use the symbols \(\uparrow\) or \(\downarrow\) to select measurement units.  
- \textbf{Metric ( °C l/min)}  
- \textbf{Imperial ( °F gal/min)}  
▶ Touch the symbol \textbf{ok} after selecting the desired units.  
The selected units blinks, display indicates \textbf{A9 Units}.  

\textbf{AA Display Timeout}  
Activation of brightness control increases energy savings when the appliance is idle. This menu lets you control 3 parameters of the display when idle, or when the unit is not in use:  
- enable / disable brightness control  
- after which time the brightness control is activated  
- brightness level  
▶ Access to information / adjustments menu.  
Display shows \textit{SA Settings}.  
▶ Touch the symbol \(\uparrow\) until the display shows \textbf{AA Display Timeout}.  
▶ Touch the symbol \textbf{ok} .  
Display shows \textbf{Backlight}.  

▶ Touch the symbol \textbf{ok} .  
Use the symbols \(\uparrow\) or \(\downarrow\) to set between 10 seconds and 1 hour.  
▶ Use the symbols \(\uparrow\) or \(\downarrow\) to set the brightness of the display when in period of inactivity.  
▶ Touch the symbol \textbf{ok} after reaching the desired brightness.  

\textbf{AC Lock Display}  
This menu allows to lock the display.  
▶ Touch the symbol \textbf{ok} .  
Display shows following menu.  
- \textbf{Off}  
- \textbf{On}  
▶ Touch symbols \(\uparrow\) or \(\downarrow\) to select the desired option.  
▶ Touch the symbol \textbf{ok}.  
The current selection is in green color.  
To unlock the screen  
▶ Touch symbols \textbf{ok} and \(\downarrow\) more than 2 seconds to unlock touch screen.  
▶ Touch the symbol \(\leftarrow\) to return to main menu.  
The display will lock after a few seconds of inactivity.  
To unlock the display,  
▶ Touch the symbols \textbf{ok} and \(\downarrow\) for 2 seconds.  

\section*{6.5.3 \textit{AU} - Technical Settings}  
\textbf{WARNING:}  
▶ Only a qualified technician is authorized to access this menu.  
▶ See section 6.6.  

\section*{6.5.4 “P9” - Purge}  
This menu allows you to purge the exhaust circuit.  
▶ Access to information / adjustments menu.  
Display shows \textbf{P4 Information}.  

\begin{figure}[h]  
\centering  
\includegraphics[width=0.5\textwidth]{backlight.png}  
\caption{Backlight control menu}  
\end{figure}  

\begin{figure}[h]  
\centering  
\includegraphics[width=0.5\textwidth]{purge.png}  
\caption{P9 - Purge}  
\end{figure}
▶ Touch the symbol \( \downarrow \) until the display shows **P9 Purge**. After 2 sec. the fan starts working to purge the exhaust circuit.

The fan remains running until the Purge menu is exited, to do so:
▶ Touch the symbol \( \leftarrow \).

### 6.6 Service menu - AU Technical Settings

**Accessing the AU Technical Settings menu**

▶ Touch the symbol \( \leftarrow \). Display shows **P4 Information**.
▶ Touch symbols \( \uparrow \) or \( \downarrow \) to select **AU Technical Settings** menu.
▶ Touch the symbol \( \text{ok} \). Display shows Technical Settings menu (password input).
▶ Select the password. The password is 1886. Technical Settings completed.
▶ Touch the symbol \( \leftarrow \). Access to **installer exclusive menus**.

- **P7 - Gas Type (LPG, NG)**
- **LM - Temperature Limited**
- **RS - Recirculation Settings**
- **PC - Cascading**
- **CA - Combustion Adjust**
- **PA - Water Actuator**
- **PF - Bypass Valve**
- **PE - Appliance Type**
- **AB Region Selection**
- **A4 Demonstration**

**P7 - Gas Type (LPG, NG)**
For more information,
▶ See section 6.8.

**LM Temperature Limited**
Unlock the Temperature Limit
▶ Touch the symbol \( \text{ok} \). Display shows following menu.
- **Unlocked**
- **Locked**
The current selection is in green color.
▶ Touch symbols \( \uparrow \) or \( \downarrow \) to select **Unlocked**.
▶ Touch the symbol \( \text{ok} \).
▶ Touch the symbol \( \leftarrow \) to return to main menu.

**RS Recirculation Settings**
To define recirculation comfort level,
▶ Touch the symbol \( \text{ok} \).
▶ Touch symbols \( \uparrow \) or \( \downarrow \) to define comfort level.
  - 1
  - 2
  - ...
  - 9

Choosing a higher comfort level (9) will set the recirculation water temperature closer to the set point defined on the water heater. Choosing a lower value (1) will favor efficiency at the expense of recirculation temperature comfort.
▶ Touch the symbol \( \text{ok} \).
▶ Touch the symbol \( \leftarrow \) to return to main menu.

**PC Cascading**
Use this menu only after installing the cascading kit (7709003962).
▶ Only a qualified technician can change this parameter.

To define cascading settings,
▶ Touch the symbol \( \text{ok} \).
▶ Touch symbols \( \uparrow \) or \( \downarrow \) to move between menus.
- **State**
  - Off
  - On
- **Mode** (Only available if State **On** is selected.)
  - Primary
  - Secondary

For more information,
▶ See Cascading kit installation manual.

**CA Combustion Adjust**
For more information,
▶ See section 8.11.

**PA Water Actuator**
For more information,
▶ See section 6.7.

**PF Bypass Valve**
To Enable or Disable bypass function.
6.7 Water valves calibration

Water valve calibration must be done when main water valve or bypass valve is replaced. Also required when electronic control unit is replaced.

The water valve calibration process takes several minutes.

Only possible after access Technical Settings menu (→ section 6.6).

6.7.1 MF main-water valve auto calibration

Open one hot water faucet.

Before moving to the next step,

Access menu PA.

Touch symbol OK.

Touch symbols ▲ or ▼ to select MF main valve.

Touch symbol OK.

The appliance will start the auto calibration of main valve.

Water flow will shut-off.

Wait until indication of calibration completed appears on the screen.

Touch the symbol ← to return to main menu.

6.7.2 BP bypass valve auto calibration

Open one hot water faucet.

Flow rate between 0.80 GPM and 1.80 GPM is required.

It's possible to confirm this value by entering BP bypass-water valve menu.

Access menu PA.

Touch symbol OK.

Touch symbols ▲ or ▼ to select BP bypass-water valve.
Touch symbol OK.
The appliance will start the auto calibration of the bypass valve.

The display shows the flow rate.
▶ You should adjust the flow rate at the beginning of the calibration process.
▶ Wait for the indication that the calibration is completed to appear on the screen.

Touch the symbol to return to main menu.

6.8 Gas type

Only possible after access Technical Settings menu.

Access to menu P7 Gas Type.
Display shows appliance gas type.
▶ Use the symbols or to confirm gas type.

WARNING:
The gas type conversion must only be carried out by a qualified contractor.

Touch the symbol OK.
Display blinks 3 times and return to P7 menu.

6.8.1 Gas conversion from NG to LPG

WARNING: Fatal accidents!
Before any service or testing in the appliance,
▶ Turn off the appliance.
▶ Disconnect the power supply cord.
▶ Shut off the gas supply.

WARNING:
The gas type conversion must only be carried out by a qualified contractor.

Turn Off the appliance.
7 Maintenance and service

**DANGER:**
- Always shut off the electrical power supply, shut off the manual gas valve and shut off the water valves before servicing.

**DANGER:**
**Risk of explosion!**
- Replace all dismantled seals and o-rings with new ones.

**NOTICE:**
- Inspect the complete water heating system once a year.
- Follow points 5 and 6 in Table 22 after 400 operation hours or 25000 cycles (whichever occurs first), see chapter 6.5.1 (Data History).
- Inspect the water heater and components for wear or fatigue. Immediately repair all faults to avoid damage to the system.

### Required Annual Maintenance Table

<table>
<thead>
<tr>
<th></th>
<th>Every year</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Inspect venting system</td>
<td>X</td>
</tr>
<tr>
<td>2. Inspect combustion chamber</td>
<td>X</td>
</tr>
<tr>
<td>3. Inspect burner</td>
<td>X&lt;sup&gt;1&lt;/sup&gt;</td>
</tr>
<tr>
<td>4. Inspect pressure relief</td>
<td>X</td>
</tr>
<tr>
<td>5. Inspect water filter</td>
<td>X</td>
</tr>
<tr>
<td>6. Heat Exchanger Descaling</td>
<td>X&lt;sup&gt;2&lt;/sup&gt;</td>
</tr>
<tr>
<td>7. Inspect condensate trap</td>
<td>X</td>
</tr>
<tr>
<td>8. Inspect air filter</td>
<td>X&lt;sup&gt;1&lt;/sup&gt;</td>
</tr>
</tbody>
</table>

<sup>1</sup> Proceed with air filter cleaning or replacement if error code CE, CF and C2 is displayed. Check the flue exhaust for blockage (appliance is protected against flue blockage).

<sup>2</sup> Proceed with heat exchanger descaling whenever error codes AA and E5 are displayed (appliance is protected against overheating in case of scaling), see table 17 Water Quality.

---

**Fig. 49 160kBTU appliance gas conversion kit**

- Tighten the four screws.
- Open the gas supply valve.
- Turn On the appliance.
- Open the faucet and check for gas leak (e.g. use leak detector fluid, like water and soap, over and around the metal plate) and act accordingly.
- Replace the front cover.
- Access the Technical Settings menu (section 6.6).
- Access to menu P7 Gas Type.
  Display shows appliance gas type.
- Use the symbols or to choose gas type LPG.
- Touch the symbol .
  The display blinks to confirm the change.

The appliance will go through an initialization process.

- Update “TYPE OF GAS” in the rating plate of the appliance using the label provided with the conversion plates.
- Confirm CO₂ and CO values, see chapter 8.10 and, if necessary, adjust Gas and Air flow parameters, see chapter 8.11 for more information.
7.1 Required annual maintenance
(To remove front cover, see page 12)

WARNING:

Maintenance must be done by a qualified contractor.

Venting System

- Venting system - Inspect inside of flue pipe and remove any blockage or restriction. Observe burner flames during heater operation (front cover must be removed). Burner flames should be steady and blue. Yellow, inconsistent (bouncing) flames may be an indication of poor ventilation or combustion air supply. Inspect the combustion air intake pipe and remove any blockage or debris. Inspect air intake and exhaust terminations and remove any blockage or debris.

Heat Exchanger

- Inspect burner observation window for cracks or spillage of flue gases. Observe burner flames during heater operation. Flames should be steady and blue with no signs of yellowing. Yellow burner flames are an indication of improper combustion. Refer to section 4.6 to verify the exhaust system and combustion air supply meets the manufacturer's specifications.

Pressure Relief

- Manually open the pressure relief valve to ensure proper operation.

Inlet Water Filter

- Verify the inlet water filter screen is clean and undamaged. The inlet water filter is located on the top of the appliance, at the cold water inlet connection. (See fig. 29, page 38). Close the installer supplied water shutoff valve, purge the water using discharge drains and remove the brass hex cap holding filter. Remove the filter, clean and/or replace if damaged.

Descaling

- In areas where the water supply has a high mineral content (see table 17 Water Quality) the heat exchanger must be flushed with a descaling solution. Scale build up will shorten the life of the water heater and damage resulting from scale is not covered under warranty. Refer to section 7.3 for detailed instructions on descaling the heat exchanger.

Condensate Trap

- Check for debris and clean if needed.

Air Filter

- Verify if the air filter is clean and undamaged. The air filter is attached to the fan assembly, see fig. 50. Air filter must be cleaned or replaced in case it is clogged or damaged.

How to remove/assembly air filter

▶ Disconnect the electrical supply from the water heater.
▶ Remove appliance front cover, see page 12.
▶ Loosen two philips head screws.
▶ Remove air filter from the fan.
▶ Proceed in the reverse order for assembly.

NOTICE:

Appliance malfunction!

Air filter should not be removed during appliance normal operation as, it may increase the risk of burner blockage.

7.2 Winterizing for seasonal use

The water heater must not be installed in a location where it may be exposed to freezing temperatures unless connected to electrical power. All water must be drained from the heater in order to avoid damage to the unit from exposure to freezing temperatures.

NOTICE:

Use of agents such as anti-freeze is not permitted and voids the warranty, as they may cause damage to the water heater's internal components.

1. Hold ON/OFF switch on the water heater for 3 secs. to turn OFF the heater and unplug the power supply cord. The display should be blank.
2. Shut off the gas supply to the water heater.
3. Shut off the water supply to the water heater using installer supplied shutoff valve.
4. Open hot water faucets to drain and relieve pressure from the plumbing system. If water continues to flow after 5 minutes, a crossover of the hot and cold water pipes is present and must be corrected before proceeding.
5. Disconnect the inlet and outlet water pipes from the water heater. Place a small bucket underneath the water heater to catch residual water remaining inside the water heater.
6. Using an air compressor, blow short bursts of air (50 psi max) through the inlet water connection or inlet water filter until there is no water present coming through the outlet water connection of the heater.
7. Empty condensate trap.
8. Reconnect the water fittings and return the heater to service when danger of freezing has passed.

7.3 Mineral scale build-up

Periodic descaling may be necessary in areas with high mineral content in the water (see table 17 Water Quality). Scale buildup in the heat exchanger may result in lower flow rates, error codes of AA, E3, E5 and boiling sounds in the heat exchanger.

A water softener is required if the water hardness exceeds 12 grains/gal (200 mg/l) calcium carbonate. Damage to the water heater resulting from hard water/scale deposits will not be covered under warranty.

Descaling using a pump

- Disconnect the electrical supply from the water heater.
- Shut off the water supply to the water heater.
- Open hot water faucets to drain and relieve pressure from the plumbing system.
- Shut off hot water valve to the water heater.
- Connect a line (A) from the outlet of the circulating pump (installer supplied) to the inlet drain connection on the water heater (see fig. 51.)
- Using another line (B), connect the outlet drain connection on the water heater. Route the other end of this line into a descaling reservoir.
- Using a 3rd line (C) from the descaling reservoir, connect to the inlet side of circulating pump. Install a filter on the end of the line in the descaling reservoir.
- Make sure all connections are water tight.
- Fill the descaling reservoir with descaling solution so both lines inside are submersed. We recommend a straight white vinegar solution. If using a commercial descaler, refer to manufacturer's instructions for proper dilution ratio.
- Ensure both drain connections are open.
- Operate the circulating pump.

- Make sure there are no leaks and the solution is flowing from the descaling reservoir through the heater and returning to the reservoir.
- Run the solution through the heater until the solution returning to the descaling reservoir comes out clear. (Changing to a fresh solution may be necessary during this process).
- Disconnect all lines and drain all solution from heat exchanger. Properly discard the solution.
- Close the inlet drain connection.
- Position a container below the outlet drain connection and connect the cold water supply. Open the cold water supply shutoff valve and flush the heat exchanger with clean water.
- Close the cold water shutoff valve and reconnect hot water supply to the water heater.
- Close the outlet drain connection.
- Reconnect the electrical supply to the unit, open the water shutoff valves, and return the unit to service.

Fig. 51

[1] Pump
8 Troubleshooting

⚠️ WARNING:

> If you are unable to perform the tasks listed below, or need additional assistance please contact a service provider or contractor.

NOTICE:

In some areas local code may require that the tasks described in this section must be performed by a certified contractor.

> Please check your local codes to ensure compliance.

8.1 Introduction

Many of the questions customers ask regarding operation of this unit can be answered by following the troubleshooting steps as outlined below. For best results, perform each step before proceeding to the next. The suggested solutions may require that the cover be taken off (see fig. 3, page 12).

8.2 Burner does not ignite when a hot water faucet is opened

It is recommended to use “P4 Information” page 47, chapter 6.5.1 as a tool for problem solving.

1. If the display is blank, verify power at the outlet. (120VAC/60Hz properly grounded circuit required). Confirm power to the heater. Check all wire connections including plugged connectors.

2. Verify if the fuse in the control board is good. To access the fuse, the control board must be removed. See chapter 5.2, page 44.

3. Make sure cold water inlet connection is plumbed to the right side of the heater when facing unit. See fig. 28, page 38.

4. A minimum of 0.45 gallons per minute (1.7 l/m) of hot water demand is required to activate the heater. Confirm at least 0.4 gpm flow by timing how long it takes to fill a container. A quart container should fill in 20 seconds or less, from the hot water faucet only. Gradually increase water flow (hot water demand) through the heater to determine if the heater activates with higher flow.

5. Clean the inlet water filter screen per chapter 4.10, page 37.

6. Inspect the water path for obstructions. Make sure all shower heads, faucet aerators and whole house filters are clear of debris.

7. Check for a plumbing crossover. A crossover in the hot and cold plumbing pipes creates back pressure on the water flowing through the heater. Therefore, a higher flow rate than normal is needed to force the heater to activate. To check for a plumbing crossover, shut off the cold water supply to the water heater. Then open all of the hot water faucets served by the water heater. Wait 10 minutes and check for water flow at each faucet. There should be no water flowing. Any continuous flow of water, small or large, indicates a crossover is present and must be corrected. Consult a professional plumber for help in correcting a crossover. Failing single lever faucet mixing valves are common causes of plumbing crossovers.

8. With the water heater’s power supply cord unplugged, remove the unit’s front cover (See fig. 3, page 12). Check all wire connections between the water valve/water flow sensor, control unit and electrode set. See chapter 64, page 71.

8.3 Water is too hot

1. Selected temperature on the unit is too high. To lower output temperature, see chapter 6.4, page 45.

2. Confirm the heater’s gas type coincides with the type of gas being supplied. See fig. 2, page 12 for location of rating plate.

8.4 Water is not hot enough

1. Selected temperature on the unit is too low. To raise output temperature, see chapter 6.4, page 6.4.

2. Confirm the heater’s gas type coincides with the type of gas being supplied. See fig. 2, page 12 for location of rating plate.

3. Verify gas pressure is in accordance with specifications in chapter 4.13, page 43. A gas pressure reading is needed to proceed further. Contact your original installer or a local certified gas technician to obtain this reading.

5. Cold water is mixing into the hot water lines (plumbing crossover). A plumbing crossover can unintentionally mix cold water with the hot water leaving the heater. The end result is a cooler water temperature than desired. To check for a plumbing crossover, shut off the cold water supply to the water heater. Then open all of the hot water faucets served by the heater. Wait 10 minutes and check all faucets for water flow. There should be no water flowing. Any continuous flow of water, small or large, indicates a crossover and must be corrected. Consult a professional plumber for help in correcting a crossover. Failing single lever faucet mixing valves are common causes of plumbing crossovers.
Troubleshooting

8.5 Low water flow/pressure

1. Too many hot water applications are being used simultaneously or too much flow is demanded. The water heater will effectively support two 2.0-2.5 GPM shower heads simultaneously or multiple sink applications. Greater draws will result in a water pressure drop and reduced flow at faucets.

2. If the selected temperature on the unit is set too high for the demanded flow rate, the water heater will close its motorized water valve, reducing the hot water flow rate in an attempt to reach the selected output temperature. Lowering the selected temperature will allow the motorized water valve to open up for increased water flow rate.

3. Clean inlet filter screen as instructed in chapter 7.1, page 55 to increase flow through the heater.

4. Inspect the water path for obstructions. Make sure all shower heads, faucet aerators and whole house filters are clear of debris. It may be necessary to upgrade to higher flow rate shower heads if allowed by local code.

5. In areas where the water has a high mineral content, periodic descaling may necessary. See chapter 7.3, page 56 for directions.

8.6 Hot water temperature fluctuates at faucet

1. If the water heater set point temperature is high, mixing at the faucet could deactivate the water heater. The addition of too much cold will overpower hot water flow from the tankless water heater reducing its flow below the activation point. If this slows the flow through the tankless water heater below its deactivation point, it will shut off the burner.

2. Unbalanced pressure in water lines. Any restriction in the water heater, such as a clogged inlet water filter screen, can result in unequal pressures between the cold and hot water lines. In such cases, when mixing in the higher pressure cold water at the faucet, the lower pressure hot water can be overpowered. This will shut down the burners because the hot water flow rate falls below the minimum flow rate required for activation. Verify that the inlet water filter screen is clean and clear of debris. See chapter 7.1, page 55 for inlet water filter cleaning instructions.

3. The water heater may be deactivated by temperature balancing shower valves. If the water heater’s set point temperature is set too high, the temperature balance shower valve will automatically mix in cold water to reduce the hot water temperature. An adjustment should be made to minimize the amount of cold water the valve is adding. Additionally, the temperature setting on the water heater can be lowered to reduce the amount of cold water that the temperature balance valve mixes in.

4. Inlet water pressure is erratic due to fluctuating supply water pressure. For installation on a private well system with the use of a pressure tank, the lowest pressure range setting recommended is 30 - 45 psi (2.06 - 3.1 bar). Consult your installer or local plumber for effective ways to maintain constant water pressure to the appliance when on a well system.

8.7 Noisy burner/heater during operation

Burner noises can be heard if combustion is not properly set. This could be caused by improper gas supply conditions (gas pressure and/or gas composition). Two types of noise can be heard: low pitch noise/vibration (rumbling) and high pitch noise/vibration (whistling).

8.7.1 High pitch noise

1. Verify if correct gas type is selected (see section 6.8).

2. Verify if gas pressure is within specified range (see section 3.2).

3. Ensure that the venting used is according to specifications (see section 4.6) and cross contamination does not exist. Ensure that intake and exhaust terminations maintain required clearances.

If gas type is properly selected, gas pressure is within range, the venting is according to specifications, and the problem persists:

4. Perform the gas and air adjustment as described in section 8.11.

8.7.2 Low pitch noise

1. Verify if correct gas type is selected (see section 6.8).

2. Verify if gas pressure is within specified range (see section 3.2).

If gas type is properly selected, gas pressure is within range, the venting is according to specifications, and the problem persists:

3. Perform the gas and air adjustment as described in section 8.11.

8.8 Error codes C1, C2, CF and/or CE

C1, C2, CF and CE errors could be caused by a too long flue and/or an obstruction in the venting.

1. Verify if there are any venting obstructions and remove them if that is the case.

2. Clean or replace the air filter, see chapter 7.1, page 55.

3. Ensure that the venting used is according to specifications (see section 4.6).

4. Reset the error by holding the On/Off button for 3s. If there are no obstructions and venting is according to specifications, and the problem persists:

5. Perform the gas and air adjustment as described in section 8.11.
6. If it is not possible to solve the problem with these measures and error persists, the burner surface (ceramat) might be obstructed (e.g. clogging due to dust/particles in the air). Contact Bosch support line for further assistance into the diagnosis if your installation fits this description; in case of confirmation, replace the burner and revise installation conditions (→ section 4.3) to avoid reoccurrence.

8.9 Error codes EA and/or EC
EA and EC errors can appear if combustion is not properly set. This could be caused by improper gas supply conditions (gas pressure and/or gas composition).

1. Verify if correct gas type is selected (see section 6.8).
2. Verify if gas pressure is within specified range (see section 3.2).
   If gas type is properly selected, gas pressure is within range, the venting is according to specifications, and the problem persists:
3. Perform the gas and air adjustment as described in section 8.11.

8.10 Manifold gas pressure
The manifold gas pressure measurement is only carried out if it is necessary to confirm the value from the rating plate. In case of a high deviation between measured and stated values, please proceed with Gas/air adjustment (see section 8.11).

▶ Turn Off the appliance.

Fig. 52 Pressure head points
[1] Air pressure head in the box
[2] Gas pressure head in the burner
[3] Tee (installer supplied)

▶ Loosen the set screw of the pressure head point [B].
▶ Connect the pressure gauge connection '+' to the test point [B].
▶ Connect the pressure gauge '-' to the pressure head point [A] using the accessory [C].
▶ Turn On the appliance.
▶ Position the front cover near the appliance and make sure the cable for the display is connected.
▶ Open all hot water faucets to achieve a flow rate of at least 6 gallons per minute. (1 tub and 2 sinks should be sufficient). If heater goes back to P2, open more hot water fixtures to allow sufficient flow and access to P1 menu.
▶ Record the manifold gas pressure reading in table 23.
Manifold gas pressure refers to the relative pressure between gas manifold nozzles inlet and outlet [A]-[B].

<table>
<thead>
<tr>
<th>Value</th>
<th>Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>Manifold gas pressure</td>
<td></td>
</tr>
</tbody>
</table>

Table 23
▶ Turn Off the appliance.

1) Manifold gas pressure from the rating plate is valid for sea level operation with standard gas pressure and composition. If operating conditions are different from those, values from section 8.11 should prevail over manifold gas pressure to assure a correct appliance tuning.
Troubleshooting

► Disconnect the pressure gauges from the pressure heads points [A] and [B].
► Tighten the shutter screws of the pressure heads points [A] and [B].
► Reassemble the front cover onto the appliance.
► Turn ON the appliance to return to normal operation.

8.11 Gas and Air Adjustment

Gas/Air adjustments are only required when;
• The appliance is converted to LPG (→ section 6.8).
• The appliance shows repeated unresolved errors (→ chapter 9).
• After the replacement of the electronic control unit, fan or gas valve.

The gas and air adjustment can be completed in two ways:
• Automatic <UC - Auto Adjust> (→ section 8.11.1).
• Manually <MA - Manual Adjust> (→ section 8.11.2).

Improper gas pressure will affect combustion.
► Please see chapter 4.13 for more information.

Access to CA Combustion Adjust menu is only possible after accessing to AU Technical Settings menu (→ section 6.6).

After enter AU Technical Settings menu,
► Touch symbols \ or \ to select CA menu. Display shows CA Combustion Adjust.
► Touch the symbol ok to enter CA menu.
• UC - Auto Adjust
• MA - Manual Adjust
• ...

Fig. 53 CA Combustion Adjust

8.11.1 Automatic Gas and Air adjustment

The UC Auto Adjust is the automatic Gas and Air adjustment process. This process takes approximately 15 minutes, and does not require any intervention besides ensuring that enough water flow is provided to the appliance.

To perform UC Auto Adjust of Gas/Air flow;

After enter CA Combustion Settings menu,
► Touch symbols \ or \ to select UC menu.
► Touch the symbol ok to enter UC menu. Automatic adjustment has initiated.

Fig. 54 Auto Adjustment

► Open hot water faucets when the display shows Open Taps.
This message will appear approximately 5 minutes after initiate the automatic adjustment.
The appliance will display Open Taps whenever more flow is required to continue the automatic adjustment process (1 tub and 2 sinks are usually sufficient).
Fig. 55  Auto Adjust - Open Taps

▶ Wait until a green check mark is displayed indicating the successful conclusion of the automatic adjustment.
▶ Touch the symbol \( \leftarrow \) to exit UC menu.

Fig. 56  Auto Adjust complete

Gas and Air auto adjustment is complete.

In case of failure in the auto calibration process verify if:
▶ Gas type and pressure are correct (\( \rightarrow \) section 4.13).
▶ Vent length is according to specification (\( \rightarrow \) section 4.6).
▶ Wind conditions are stable (e.g. wind gusts may be a cause of failure).
▶ Hot water flow is sufficient and stable (e.g. water from a well is a potential source of water instability).

In case of positive results for all these actions:
▶ Perform manual adjustment according to chapter 8.11.2 or contact Bosch support line for further assistance.

8.11.2 Manual Gas and Air Adjustment
Gas and Air adjustment is also possible to perform manually.
This is only recommended if the automatic adjustment process is not possible to complete successfully.

To perform MA Manual Adjust of Gas/Air flow;
▶ After enter CA Combustion Adjust menu,
▶ Touch symbols \( \leftarrow \) or \( \rightarrow \) to select MA menu.

Fig. 57  Manual Adjust - MA

Access P1 menu (maximum power)
L1 Gas Adjust
▶ Touch the symbol \( \rightarrow \) to enter P1 menu.
Display shows L1 Gas Adjust.

Fig. 58  L1 Gas Adjust - Open Taps

▶ Open hot water faucets when the display shows Open Taps.
The appliance will display Open Taps whenever more flow is required to continue the automatic adjustment process (1 tub and 2 sinks are usually sufficient).
Display shows Output Power (%) when there is enough water flow.1)

1) More flow may be required if inlet water temperature is high, i.e. applications with waste water recovery system, preheated solar water.
Troubleshooting

- Change L1 Gas Adjust parameter until power reaches 100% ± 2%
- Increase L1 Gas Adjust parameter to increase output power, and vice-versa.

How to enter a new tuning parameter (i.e. L1, L2, A1, A2).
- Select the desired parameter.
- Touch the symbol ok .
  The symbols ⇧ appears in the display.
- Change to the desired value.
- Touch the symbol ok when finished.
  The symbols ⇧ disappear.

- L1 Gas Adjust is now complete.

A1 Air Adjust
- Touch symbols ⇧ or ⇩ until display shows A1 Air Adjust - ION.
- Change A1 Air Adjust parameter until ION ratio reaches 100% ± 2%.

B1 Internal Adjust
- Touch symbols ⇧ or ⇩ until display shows B1 Internal Adjust.

Fig. 60  B1 Internal Adjust - P1 Active
- Touch the symbol ok to enter B1 Internal Adjust. 1) B1 Internal Adjust will start automatically.
- Wait approximately 60 seconds until a green check mark appears in the display, which indicates that the B1 Internal Adjust is completed. Do not interfere with the appliance during this period.

Fig. 61  B1 Internal adjust is completed

L2 Gas Adjust
- Touch the symbol ⇧ to enter L2 Gas Adjust.
  L2 Gas Adjust value is shown (ionization).
- Change L2 Gas Adjust parameter until ION ratio reaches 100% ± 2%.

1) B1 Internal Adjust will calculate automatically the amount of air in low fire (P2). This method uses P1 values to start calculation.
Increase L2 Gas Adjust parameter to increase ION ratio and vice-versa.

Fig. 62  L2 Gas Adjust - ION ratio

Touch the symbol ok to save value.
Touch the symbol ▼ to return to the main menu.
Minimum power adjust is completed.

Gas and Air adjustment is complete.

8.11.3 Restore factory values

To restore factory values for combustion settings,
Proceed with the following steps.

To enter P1 and P2 menu,
Access to AU Technical Settings menu.
Touch symbols ▲ or ▼ to select CA menu.
Display shows CA Combustion Adjust.
Touch the symbol ok to enter CA menu.
Touch symbols ▲ or ▼ to select MA - Manual Adjust menu.
Touch the symbol ok to enter P1 or P2 menu.

Reset Parameters P1
After enter MA - Manual Adjust,
Access to menu P1.
Touch symbols ▲ or ▼ to select Reset Parameters.
Touch the symbol ok. The factory default values for P1 are restored.

Reset Parameters P2
After enter MA - Manual Adjust,
Access to menu P2.
Touch symbols ▲ or ▼ to select Reset Parameters.
Touch the symbol ok. The factory default values for P2 are restored.

8.11.4 Additional combustion settings
The parameters and operation modes presented in this section are available for certification purposes and advanced troubleshooting with guidance from BOSCH support line.
For optimal operation, use the default settings.

IC - Ionization control

Default setting is On.
Only a qualified technician can change this parameter.

PD Power derate

Default setting is On.
Only a qualified technician can change this parameter.

Minimum power and check (P2)

Only a qualified technician can change this parameter.

PP P2A2

Default setting is On.
Only a qualified technician can change this parameter.

P1 Max. Power - Ionization control

Default setting is Off.
Only a qualified technician can change this parameter.

P0 Min. Power - Ionization control

Default setting is Off.
Only a qualified technician can change this parameter.
8.12 CO emissions check
In case air/gas combustion adjustment has been performed check emissions using reference values in tables 24 and 25.

8.12.1 Access to measuring port

⚠️ WARNING:
Only a qualified technician can perform these steps.
This can cause carbon monoxide poisoning.

- Follow the instructions carefully and avoid leaving the measuring port open.

Allow the appliance to stabilize before performing CO readings. Let appliance warm up and wait for 2 or 5 minutes for each CO reading. This will avoid wrong CO readings.

- Open a hot water faucet and let the appliance work for 2 or 5 minutes.
- Remove the screw from the flue adaptor on the left side of the appliance, as seen in fig. 63.
- Insert analyzer probe into the measuring port. The tip of the probe should be in the center of the flue pipe (approx. 1.5" inserted). Avoid air gaps between probe and measuring port as they can alter readings.

![Fig. 63 Measuring port](image)

8.12.2 CO₂ and CO values

8.12.3 Returning to Service

- Remove the analyzer probe and insert the screw into the flue adaptor.
  Once the measurement is complete,
- Touch the symbol  to exit service menu.
  The appliance is ready for normal operation.
## 9 Problem solving

### 9.1 Error code diagnostics

To remove error codes from the display,
- Touch the On/Off button more than 3 sec. (long press).

Installation, maintenance and repair must only be carried out by qualified contractors. The following table describes the solutions for possible problems.

<table>
<thead>
<tr>

   If the problem persists:  
   ▶ Replace the wire connections and/or electronic control unit.  
   1) |
| FA      | Gas leakage in the gas path (gas valve or gas manifold shut-off valves). | ▶ Replace the gas valve and/or gas manifold.  
   ▶ After gas valve and/or gas manifold replacement perform gas and air tuning (→ section 8.11).  
   1) |
| FC      | Touch screen key pressed for more than 20 seconds. | ▶ Release the touch screen key.  
   ▶ Clean the touch screen display. |
| Display reads SOLAR but without existence of solar thermal system. Display reads SOLAR and water temperature low. | Power demand lower than appliance minimum output power. | ▶ Increase hot water flow.  
   ▶ Increase setpoint temperature. |
| Display shows a red X. | HMI (display) is not communicating with Electronic Control Unit. | ▶ Reset the appliance by unplugging it for some seconds (at least 10) and plug it back in.  
   ▶ Replace the HMI (display) and/or wire connections and/or electronic control unit. |
| High pitch noise (whistling) | Combustion flame with gas in excess or lack of air. | ▶ Check if gas type is correct (→ section 6.8).  
   ▶ Check gas inlet pressure (→ section 4.13).  
   ▶ Perform gas and air tuning (→ section 8.11).  
   1) |
| Low pitch noise with vibration (rumbling) | Combustion flame with air in excess or lack of gas. | ▶ Check if gas type is correct (→ section 6.8).  
   ▶ Check gas inlet pressure (→ section 4.13).  
   ▶ Perform gas and air tuning (→ section 8.11).  
   1) |

1) Only to be carried out by qualified contractors.  
2) See temperature resistance charts in fig. 65 and 66.  
3) Error reset also possible by shutting-off water flow to the unit, and turning it back on.
4) Error reset also possible by shutting-off water flow to the unit, and turning it back on, limited to 3 times per hour. It can take up to 3 minutes for appliance initialization.

Table 26

Note: If the appliance is locked for safety reasons, information is shown on the display to give more information on the problem. Once the problem is solved, you may have to reset the error (touch and hold button for 3 seconds). Error reset will only take effect if error is visible on the display.

[1] Inlet water filter
[2] Air fan
[3] Control unit
[5] Burner
[7] Condensing unit
[8] Main water valve
[9] By-pass pipe
[10] HE drain
[12] Gas connection

[13] Condensate drain
[14] HE drain
[16] Condensate trap
[17] By-pass water valve
[18] Ionization sensor
[19] Ignition electrodes
[20] PRV connection
13 Protecting the environment

Packing
The packing box may be fully recycled as confirmed by the recycling symbol ⬇️.

Components
Many parts in the heater can be fully recycled at the end of the product life. Contact your city authorities for information about the disposal of recyclable products.

Saving water resources:
▶ Make sure you close all the faucets after any use. Avoid leaving the faucets dripping. Repair any leaking faucet.
▶ Define the temperature you want, in the appliance or with the remote control. This way you have the precise water flow needed (mixing cold water to regulate temperature will increase the water flow with consequent waste of water).

14 Installer Checklist to be completed by installer upon installation

| Serial Number¹ |  
| Gas Pressure Reading² |
| Static |
| Dynamic |
| Water Pressure |
| Building Water Pressure |
| Pressure Range if on Well system |
| Installing Company |
| Installer name |
| Address |
| Phone |

1) Serial number is located on the rating plate which is located on the left side (when facing appliance front) of the appliance cabinet.
2) See Chapter 4.13 and gas pressure table (to be filled out by installer).

Table 27

Installation manual should be left with the owner after the installation is tested and completed. Additional copies of the installation manual are available at www.boschheatingandcooling.com.
